Title: Email Delivery and Mailbox Synchronization Guide
Category: email_collaboration

[SAMPLE DOCUMENT - synthetic content for the HelpDeskAI project, not an official company policy]

Symptoms and scope
New messages are missing from the desktop mail client, outgoing messages remain in the outbox, or a sender receives a delivery notice.

Troubleshooting procedure

1. Open Meridian Mailroom in the approved browser and sign in. Check whether the message is visible in webmail. If it is visible there but not in the desktop client, the issue is likely client synchronization rather than message delivery.

2. Check the Outbox, Drafts, and Junk folders, and confirm that the recipient address is correct. Send a harmless test message to an approved internal test recipient if available; do not send repeated tests to external recipients.

3. Use the client's Refresh or Sync command and wait 5 minutes. Confirm the device has working internet access. If webmail also fails, check Meridian Status Board before changing the account or removing the mail profile.

4. Search the mailbox using the sender, subject, and approximate date. Deleted messages may remain recoverable for 14 days in the supported deleted-items area. Do not promise recovery after that period and do not use third-party recovery utilities.

Ownership and handoff
The Service Desk handles client synchronization, folder checks, and initial delivery details. Collaboration Services owns mail transport and mailbox service incidents. The recipient's manager or data owner decides whether access to a mailbox is appropriate; the Service Desk does not grant business authorization.

Escalation and priority
Use low priority for one delayed message with a working webmail workaround. Use medium priority if synchronization remains broken after the 5-minute refresh or outbound messages are blocked. Use high priority for a widespread delivery failure affecting a team. A suspected account compromise must be reported through the account-security route immediately.

Diagnostic details and records
MAIL-422 means the desktop client has not synchronized its latest mailbox state after a manual refresh. Include sender and recipient internal identifiers, message time, client type, and whether webmail shows the message. Never include passwords or full message contents unless requested through an approved secure process.

Questions and answers

Q: Does a shared mailbox behave like a distribution list?
A: No. A shared mailbox stores messages in a common mailbox; a distribution list routes a message to its members.

Q: Can I recover a message deleted last month?
A: The standard recoverable period described here is 14 days, so a message older than that may no longer be available through the normal recovery area.

Ticket quality checklist
Before submitting, confirm that the report states the observed symptom rather than only a guessed cause. Separate facts from assumptions, include the time and location, and describe the troubleshooting already completed. If a step

could expose a person to electrical, battery, water, or moving-equipment hazards, stop and use the safety escalation route instead of continuing. Do not bypass access controls, disable security protections, open sealed equipment, or use another person's account. A support team may ask for additional evidence, but provide it only through the approved company channel and only when it is needed to diagnose the issue.

Expected outcome

A successful first-line check should either restore the affected function or narrow the fault to a specific service, device, destination, or building component. If the result is unchanged, preserve the original error text and report which numbered steps were completed. Do not repeat a failed action indefinitely; use the stated escalation condition and let the owning team continue diagnosis.
